Publication Title:

LIQUID CRYSTAL DISPLAY DEVICE

Abstract:

Abstract of JP7146473

**PURPOSE:**To enhance the economy in use of a display device which can serve both for an OHP and a monitor. **CONSTITUTION:**In a display casing 1, two liquid crystal panels 2, 4 are installed, between which a fluorescent lamp 5 is furnished. If this is used in an OHP, the panel 2 is set in the transmissive condition, and light from an OHP light source 6 is allowed to pass through it and cast onto the other panel 4 so that an enlarged picture is projected on a screen. If this liquid crystal display device is used in a monitor, on the other hand, the panel 2 is set in the light shutting condition, and the light from the fluorescent lamp 5 is reflected diffusively and cast onto the panel 4 so that a direct view image is generated.
